OPERATION MANUAL

Please read this Operation Manual carefully before use, and file for future reference.
Thank you for purchasing the NSK Surgic XT Plus surgical unit.
We recommend that prior to use, you carefully read this document regarding instructions for use, handling method, or maintenance check so that you can carry on using the unit in the future. In addition, keep this operation manual in a place where a user can refer to it at any given time.

Classified equipment
- Type of protection against electric shock:
  - Class I equipment
- Degree of protection against electric shock:
  - Type BF applied part
- Method of sterilization or disinfection recommended by the manufacturer:
  - See 8. Sterilization
- Degree of protection against ingress of water as detailed in the current edition of IEC 60529:
  - Foot Control: IPX8 (Protected against the effects of continuous immersion in water)
- Degree of safety of application in the presence of a flammable anesthetic mixture with air or with oxygen or nitrous oxide:
  - Motor, Foot Control: Category AP Equipment
- Mode of operation:
  - Intermittent operation

Cautions for handling and operation
- Read these safety cautions thoroughly before use and operate the product properly.
- These indicators are to allow you to use the product safely, prevent danger and harm to you and others. These are classified by degree of danger, damage and seriousness. All indicators concern safety, be sure to follow them.

<table>

1. Safety precautions prior to use
Read Handpiece’s Operation manual carefully before use.

Intended to Use
Surgic XT Plus is intended for use in dental oral surgery and surgical procedures by qualified personnel.

WARNING
The system may present a possibility of malfunction when used in the presence of an electromagnetic interference wave. Do not install the system in the vicinity of the device which emits magnetic waves. Turn off the power switch of the Control Unit of this system when an ultrasonic oscillation device or an electrode knife is located in the vicinity is used.

CAUTION
- Surgic XT Plus should not be used adjacent to or stacked with other equipment and that if adjacent or stacked use is necessary, the Control Unit should be observed to verify normal operation in the configuration in which it will be used.
- When operating this system always consider the safety of the patient.
- Read this Operation Manual before use, and fully understand the functions of each part of the operation key.
- Do not attempt to disassemble the Control Unit/Foot Control/ Micromotor nor temper with the mechanism.
- Check for vibration, noise and overheating before use and if any abnormalities are found in use, stop using immediately and contact your dealer.
- Use an electrical outlet that is grounded.
- Do not drop, hit, or subject to excessive shock.
- Do not bend the Irrigation Tube while the water pump is operating. It could cause tube breakage.
- Do not use bent, damaged or sub-standard burs. The Shank could bend or brake.
- Do not exceed the recommended speed.
- After each Operation, be sure to lubricate and sterilize the handpiece as soon as it’s cleaned. Blood coagulation can cause corrosion and rusting. However, do not lubricate the Micromotor. Oil could generate excessive heat and cause damage.
- The Control Unit can be cleaned with a moist cloth. Disconnect the power supply before cleaning. The Control Unit and the Foot Control cannot be sterilized by any method.
- When the product is very frequently used, consider the maintenance of a small stock of replaceable parts.
- Do not disconnect the Motor Cord from the motor.
- Do not wipe with or, clean or immerse in, high acid water or sterilizing solutions.
- Follow the table below for the motion time of motor and handpiece. Continuous use over a long time may cause the overheating of the handpiece, which in turn may result in an accident.
- Applied parts for patient and/or operator is Handpiece.

** No moisture condensation in the Control Unit.**
** Use at outside of these limits may cause malfunction.

3. Control Unit with an Irrigation Pump

![Diagram of Control Unit]

Description of Operation

◆ Keys on the Control Unit

(1) Program Key
Use to Cycle through available programs. Press [+] key to ascend and [-] key to descend program number. You will find all program numbers sequentially by pressing keys.

(2) Speed Key
Use to set the Micromotor speed. Press [+] key to increase, and [-] key to decrease speed. (When the upper and lower speed limits are reached an audible alarm ‘beep’ is sounded).

(3) Torque Key
Use to set the torque range. Press [+] key to increase and [-] key to decrease torque range. (When the upper and lower torque range limits are reached an audible alarm ‘beep’ is sounded). The torque range setting should be selected according to the attached handpiece gear ratio.

(4) System Key
Use to activate calibration cycle of the handpiece before use.

(5) Gear Ratio Key
Use to set gear ratio of the attached handpiece before use. Repeat press this key until the LCD display indicates the correct gear ratio of the handpiece.

(6) Coolant Flow Key
Use to select 6 levels of coolant solution flow from 0 to 5, repeat press key to cycle through coolant flow levels.

(7) FWD-REV Key
Use to select the direction of rotation. Press this key once to change the rotational direction. (Once in reverse the Control Unit audibly warns with a “beep”)

(8) Memorize Key
Use to memorize the program parameters set by the operator. Press & hold this key for approx. 1 second to memorize parameters. When beep sounds, the new program parameters have been memorized.
1. Coolant Flow Level
Displays the selected coolant solution flow level; the selected flow level is indicated by 1 to 5 levels of illuminated indicators. No illumination indicates when the Coolant Solution Flow is off.

2. Program Number
Displays the selected program number.

3. Gear Ratio
Displays the selected gear ratio of the handpiece.

4. Forward/Reverse Indicator
Displays the selected direction of the Micromotor.

5. Speed
Displays the selected speed.
Depressing Foot Control: Rotation speed of the motor displayed on the LCD (Assuming the correct gear ratio is selected)
Without pressing Foot Control: Max Rotation preset setting displayed on the LCD

6. Torque: Displays the selected torque.
* When using the 1:1 direct drive or Speed increasing handpiece, the torque is not displayed. (This function is appropriate for 2:1 increase speed handpiece or more)

7. Torque Bar Graph
Display the actual operating torque range. When all bars illuminate, the operating torque is at maximum. When bars are half illuminated then the operating torque is approximately 50% of the preset torque.

⚠️ CAUTION
The LCD display panel is produced from liquid crystal and should always be treated with care.

---

4. Foot Control

- Coolant Solution Flow Volume Button
  Use to select 6 levels of coolant solution flow from 0 to 5; each level may be increased by one step pressing this button. If you press this button in level 5, it returns to level 0.

- PRG (Program) Button
  Use to select the desired program number. Program numbers will always ascend each time this button is pressed and released. To descend, press and hold for 1 second then release.

- Speed Control Pedal
  Used to start and stop the Micromotor and to control the speed during operation. The Micromotor operational speed is directly proportional to the position of the foot control, up to the preset maximum.

- Forward/Reverse button
  Used to change the rotational direction of the Micromotor. Push once to change the rotational direction.
5. Installation

5-1 Connecting the Motor Cord
Align the [ ▲ ] mark on the Micromotor cord with [ ▼ ] mark on the Control Unit; push the Base of Micromotor Cord Plug into the socket until the locking joint ‘clicks’ into place.
To disconnect the plug; pull back the Lock Joint, pull further to disconnect the cord (Fig. 2).

5-2 Connecting the Foot Control
Face the screw on the Foot Control Cord Plug downward then insert the plug into the Foot Control Cord connector socket on the Control Unit. Secure the plug by fastening the Lock Nut. Refer Figs. 3 & 4.

5-3 Connecting the AC Electrical Cord
Correctly align then insert the AC Electrical Cord into the AC Electrical Cord Connection at the back of the Control Unit (Fig. 5).

5-4 Installing the Irrigation Tube
Mount the Irrigation tube. Ensure the pump cover lever is in the ‘OPEN’ position, with the Irrigation tube ‘Needle’ towards the backside of the Control Unit. Position the stoppers of the tube assembly into the Tube Guide securely. (Fig. 6)

5-5 Mounting the Coolant Solution Hanger Post
Mount the Coolant Solution Hanger Post onto the Holder on the Control Unit, the post will only fit into one position (Fig. 10). Place the bottle as shown in Fig. 11.

CAUTION
Make sure that the tube is securely set on the rollers when closing the Pump Cover. If the tube is not correctly positioned on the Rollers and the cover is closed, the tube could be cut or sheared. (Fig. 7)

After the tubes are correctly positioned, close the Pump Cover by turning the Pump Cover Lever to the ‘CLOSE’ position (180 degrees counterclockwise) (Fig. 8 & 9).
5-6 Insertion of the irrigation Tube

1) Close the Tube Clamp, between the Irrigation Tube Needle and the Irrigation Pump, as shown in Fig.12.

2) Insert the Irrigation Tube Needle into the Bottle Cap. (Fig.13)

3) Open the Tube Cap to supply air into the bottle. (Fig.14)

4) Open the Tube Clamp.

5-7 Compatibility check of Internal Irrigation Nozzle/Drill

Internal irrigation nozzles accompanied with this product is not necessarily fitted into all the drills on the market. Follow the instructions given below for confirmation prior to use. Failure to do so or to fit the internal irrigation nozzle into drills may cause a leakage of saline solution, which will result in problems such as rust or sudden stop of equipment during use.

Instructions:
1) Attach a bottle of saline solution to the Control Unit.
2) Connect the Internal Irrigation Nozzle into the tip of the irrigation tube.
3) Insert the Internal Irrigation Nozzle into the drill from the back (Fig 15).
4) Purge at “Maximum” for 5 seconds.

Points to be checked:
- Cleanliness of the saline solution coming out from the drill; If solution is colored there could be rust inside of the drill. If so renew the drill.
- Water Flow; If the flow is low and/or the flow from the drill is asymmetric, renew the drill.
- No water leakage between Internal Irrigation Nozzle and drill

Before use, ensure no water is leaking from the entry point of irrigation nozzle, a broken seal or no seal in the drill may be the cause. Replace the drill even if its new, saline solution ingress into handpiece will cause malfunction.

5-8 Irrigation Nozzle Attachment

X-SG20L/SG20 has 3 irrigation methods available depending on tool and application; External, Internal or both. For installation detail, refer to the attached handpiece Operation Manual.

5-9 Attaching the Tube Holder

Use the Motor Cord as a strain relief for the ‘Irrigation Tube’. It is easier to insert Motor Cord first, then the Irrigation Tube (Fig.16).

6. Operation

6-1 Programming the Micromotor Operation

The Control Unit can memorize 8 programs. Each program includes the following functions which will be automatically performed when the appropriate program number is selected.

- Gear ratio of contra angle handpieces
- Speed
- Direction of rotation
- Torque upper limit
- Coolant Solution Flow

(1) Turn on the power by pushing the Main Power Switch toward [-]; on power up program #1 is displayed by default.

(2) Select a program number by using either step (a) or step (b):
   (a) Press the [Program] Key on the Control Panel until the desired program number is displayed.
   (b) Press the [Program] button on the Foot Control until the desired program number is displayed.

(3) Selecting the Gear Ratio of the handpiece relevant to the program; Press the [Gear Ratio] Key to select the gear ratio of the handpiece (Gear Ratio will display on the LCD).

(4) Set the required max operating speed by pressing the [Speed] Key. Each time this Key is pressed display changes to the next speed level. By pressing this Key for more than 1 second brings the speed quickly to the next level until the speed display reaches its upper or lower limit.
   - When the speed setting reaches the upper or the lower limit, an audible beep is heard and the speed setting cannot be changed any further.

(5) Set the torque upper limit by pressing the [Torque] Key on the Control Panel. Each time this Key is pressed display changes to the next torque level. By pressing this Key for more than 1 second brings the torque quickly to the next level until the torque display reaches its upper or lower limit.
   - When the torque setting reaches the upper or the lower limit, an audible beep is heard and the torque setting cannot be changed any further.

(6) Set the rate of the Coolant Solution Flow volume by pressing the [Coolant Flow] Key. The rate of Coolant Solution Flow volume has 6 Flow rates (0-5) (0 = no coolant Flow).
6-2 Calibration Function

The rotation resistance of a handpiece depends on the handpiece model, condition, and internal wear of the handpiece gears. This Control Unit incorporates an automatic function to recognize the level of the resistance of the attached handpiece and Micromotor.

- This equipment is optimized to obtain the highest accuracy at a gear ratio of 1:20 (X-SG20L/SG20) when using another gear ratio, note that the accuracy decreases with an increase in the ratio relative to 1:20.
- Micro saw handpiece should not be calibrated.
- Calibration should be performed only on NSK handpiece.

(1) Connect the Micromotor to the Control Unit, Attach the handpiece to the Micromotor. Turn the power ‘ON’.
(2) Attach the calibration bur to the handpiece. (Fig. 17)
(3) Press the [Gear Ratio] Key and select the gear ratio of the handpiece.
(4) Press & hold the [SYSTEM] Key for two seconds initiates the calibration mode. The LCD displays “CAL ON-cm.”
(5) Torque Calibration (no load): Ensure the calibration bur is inserted and free to rotate (Fig. 18). Press the [SYSTEM] Key; after a notification sound the handpiece will illuminate (Optic Handpiece only) and the bur will slowly rotate. On completion the motor will stop the calibration cycle will continue to the next test (Under load).
(6) On the screen “19.6N-cm” is displayed: align and Insert the Calibration Bur to the Calibration load, Holding the bur vertically (Fig 19) press the [SYSTEM] key, after a notification sound the handpiece will illuminate (Optic Handpiece only) and the bur will slowly rotate the load cell, on completion the motor will stop, “done” is displayed, the calibration cycle will continue to the next test.

* If “FAIL” is displayed the calibration at that point has failed. Pressing the [SYSTEM] Key returns the failed process back to the start, a reattempt can be made on that point.

CAUTION

- During a process, it is important to hold the Calibration Bur vertically without applying any forcible power. Making the Calibration Bur tilt or pressing it may cause a loss in accuracy.

6-3 Optical Illumination option On/Off (X-SG20L Only)

- Factory initialized settings lamp ‘ON’

(1) Selection
1) Lamp OFF: Hold the [System] Key and turn the power ‘ON’; Two beeps notifies the operator the lights are ‘OFF’
2) Lamp ON: Press the [System] Key and turn the power ‘ON’; One beeps notifies the operator the lights are ‘ON’

(2) Confirmation
Confirm whether the lamp of the motor lights or not by the beep issued when turning the power ON.
- Long beep once: “Lights up”
- Short beep twice: “Does not light up”

NOTICE

- Repeat the above procedures when restoring operation.
- The lamp status will remain set even if the power is switched “OFF” and ‘ON.’
- This function is only applicable for an optic handpiece.

6-4 Standard Operation

All standard operational functions can be control at the Foot Control.

(1) Turn on the Main Power Switch: The Control Unit is ready to perform the Program.
(2) Select the desired program number: Step on the Foot Control PRG (Program) Button and the program display ascends to the next program number. Pressing the PRG (Program) Button for one second more will descend the to the next program number.
(3) Verify the details of the program on the display.

CAUTION

During the process, the rotational speed is automatically increased and finally rotates at high speed. Significant care should be taken to avoid danger.
4. Operating the Micromotor: Step on the speed control pedal in the middle of the Foot Control the Micromotor will start to run. The Coolant Pump will also run (if programmed). Speed increases as the pedal is depressed. When the Speed Control Pedal is fully depressed the speed reaches the maximum preset value.

CAUTION
Using the Micromotor with light ‘ON’ for more than 15 minutes continuously, the light will become hot (The maximum surface temperature might reach 45°C by the situation used.). In such cases, step using the Micromotor till the light part cools down, or use the Micromotor without turning on the light.

5. Activation of the torque limiter: During use, when the drilling load reaches the preset torque upper limit, the integrated torque limiter automatically activates to prevent over torque. When the torque limiter activates, the motor stops after beeping for 1 second. To reactivate the Micromotor, release the speed control pedal and depress it again.

7. Reversing the Micromotor rotational direction: To reverse direction of the Micromotor (and bur) simply step on the Foot Control Forward/Reverse button. A warning beep can be heard when the rotational direction is in reverse mode.

7. Care and Maintenance

7-1 Protection Circuit
An electronic circuit breaker automatically functions to protect the Micromotor and the Control Unit if the Micromotor is ever overloaded. Power supply to the Micromotor will automatically be terminated an Error code will be displayed on the Control Unit.

Resetting the Protection Circuit
To reset the Protection Circuit, release and then depress the Speed Control Pedal.

7-2 Error Codes
If an operational problem occurs the display will show an error code allowing immediate problem diagnosis.

<table>
<thead>

7-4 Replacement of the Bulb (Optic Motor ONLY)

1) Loosen Motor Housing and detach from the motor, and remove the old light bulb using the small pin, like the precision screwdriver. (Fig. 22)
2) Align and insert the connector of the new bulb into the Socket Hole securely. Screw the motor housing securely to the motor.
   * Optional Bulb: TA Bulb (Pack of 3) Order No. Y900132

7-5 Maintenance of the Control Unit and Foot Control

If blood or saline solution has stained the Control Unit or Foot Control, remove the AC Electrical Cord; wipe Control Unit or Foot Control with a damp cloth, then with an alcohol-absorbed cloth.

7-6 Maintenance of the Handpiece Attachment

For detail, refer to the attached handpiece Operation Manual.

8. Sterilization

- Autoclave sterilization is recommended.
- Autoclave sterilization is required for the first time use and after each patient as noted below.

The following items can be autoclaved.
- Implant Handpiece
- Micromotor with Motor Cord (Including the Motor Housing)
- TA Bulb
- Handpiece Stand
- Internal Irrigation Nozzle
- Tube Holder
- Nozzle Holder
- Autoclave Plug
- Calibration Bur

![Image of Sterilization Diagram]

**CAUTION**
- Make sure the power ‘OFF’ (remove the AC Electrical cord)
- Do not touch the glass of new bulb.

**CAUTION for Autoclaving**

- Clean and lubricate the handpiece before autoclaving. Autoclaving a handpiece stained with blood or debris could cause damage to the handpiece.
- Do not lubricate the Micromotor.
- Do not disconnect the Motor Cord from the Micromotor.
- The Irrigation tube is a single use disposable type and cannot be autoclaved.
- Do not use Autoclave Plug without the mounting O-Ring. It may cause a malfunction. If O-Ring had damaged, replace it immediately.
- O-Ring (Autoclave Plug): Order code 0312457102
- You can hang Autoclave Plug on the Hunger Post to prevent losing it.
- Do not hang the Autoclaving Plug with Micromotor. It may drop the motor and cause damage.

Unshielded
Unshielded

Complies with
RF emissions, CISPR11: Class B/ Group 1
Harmonic emissions: IEC61000-3-2
Voltage fluctuations/flicker emission: IEC61000-4-11
Power frequency (50/60Hz) magnetic field: IEC61000-4-8
Conducted RF: IEC61000-4-6
Radiated RF: IEC61000-4-3

NOTE 1: At 80MHz and 800MHz, the higher frequency range applies.

NOTE 2: These guidelines may not apply in all situations. Electromagnetic propagation is affected by absorption and reflection from structures, objects and people.

Recommended separation distances between portable and mobile RF communications equipment and the Surgic XT Plus.

The Surgic XT Plus is intended for use in an electromagnetic environment in which radiated RF disturbances are controlled. The customer or user of the Surgic XT Plus can help prevent electromagnetic interference by maintaining a minimum distance between portable and mobile RF communications equipment (transmitters) and the Surgic XT Plus as recommended below, according to the maximum output power of the communications equipment.

For transmitters rated at a maximum output power not listed above, the recommended separation distance 'd' in meters (m) can be estimated using the equation applicable to the frequency of the transmitter.

Recommended separation distance

\[ d = \frac{3}{P^{0.125}} \]

Where 'P' is the maximum output power rating of the transmitter in watts (W) according to the transmitter manufacturer, and (d) is the recommended separation distance in meters (m).

Field strengths from fixed RF transmitters as determined by an electromagnetic site survey should be less than the compliance level in each frequency range. Interference may occur in the vicinity of equipment marked with the following symbol:

\[ \text{Shield} \]

Unshielded

Recommended separation distances according to frequency of transmitter

\[ \text{Separation distance according to frequency of transmitter (m)} \]

</tbody>
</table>

NOTE 1: At 80MHz and 800MHz, the separation distance for the higher frequency range applies.

NOTE 2: These guidelines may not apply in all situations. Electromagnetic propagation is affected by absorption and reflection from structures, objects and people.
